

Promisec Endpoint Manager

Detect and Remediate Cyber Incidents with File Reputation Scoring and IOC Detection

Promisec Endpoint Manager is the first and only agentless solution that delivers complete endpoint detection and remediation capabilities across the enterprise, while at the same time extending the value of your current information security investments. Promisec Endpoint Manager leverages patented technology to quickly inspect your entire enterprise to uncover, analyze, and remediate abnormalities that could result in expensive incident response efforts. The solution is engineered to run at scale on every network to enable businesses of all sizes, working across every industry to cover use cases from compliance through cyber.

The Modern Threat Landscape Demands a New Type of Security Solution

Today's threat landscape is more dynamic and sophisticated than ever before—and traditional security solutions like Malware detection and Anti-Virus scanners simply have not kept up with the kinds of threats that are plaguing Enterprises. What's missing? Put simply, a way to confirm—on a continuous basis—that what is running on your endpoints is supposed to be and how to remediate when its not. To do this effectively requires integration across all security products and security policies controlling your endpoints as well as understanding when change occurs and what caused the change (eg Patch vs potential malware) as well as proactive detection of detection for the latest threats hitting the Enterprise. Today's threat landscape demands this level sophistication to ensure integrity and control across all IT systems.

Designed to meet the increasingly complex endpoint security needs of large global enterprises, Promisec Endpoint Manager provides complete visibility into endpoint status throughout the enterprise; compares current status with security and network policies to assess gaps in alignment; and enables manual or automatic remediation and reporting. In so doing, Promisec Endpoint Manager provides integrity, visibility and control across:

- **Infrastructure:** confirm that all desktops, laptops and servers on Windows, Linux and Mac have security controls that are properly configured and all agent-based Anti-virus, patch management, encryption and firewall solutions are fully operational.
- **Applications:** confirm that all software assets are known including what is licensed as well as patches are deployed and all unauthorized, shadow IT applications are identified and removed.
- **Users:** confirm that all local and group policies are compliant and enforced.
- **Cyber:** confirm and classify all file additions and changes quickly as good (ie OS patch) or bad (ie actual or suspicious threat).

Come See What We See

Promisec Endpoint Manager is simple, easy to use, quick to implement, and shareable across every environment. The Promisec platform can be tailored to meet the specific needs of multiple departments within an organization covering numerous use cases. This flexibility allows for unprecedented [ROI](#).

Cyber investigation to Incident Response

Promisec helps Cyber Investigation and Incident Response teams to be proactive and to bring the fight directly to the attackers to enable these teams to go "on the hunt" and identify systems running problem malware and advanced threats. Promisec provides File Integrity Monitoring and File Reputation Scoring which combined identifies changes to files and processes with real time threat intel to identify advanced attacks. Got a threat feed already? Use that feed to quickly survey your entire Enterprise for the latest threats. Then deep dive via forensics to grab a complete file listing on suspect endpoints.

Shadow IT Driving Application Controls

Promisec can provide you the level of visibility and control of what's running on your endpoints through our own blacklisting and removal technologies that are backed thru continuous research of the latest apps that are plaguing IT organizations. As new apps begin to proliferate, blacklisting allows you complete control to tailor what is allowed to run and create exclusion lists for allowed applications. Through golden imaging, endpoints can be tightly controlled from the OS up through the applications and users.

Software License and Asset Management

Promisec enables you to see what hardware and software is installed on every system and categorizes your SW and HW assets in the process as well as allowing notations in custom columns. Knowing what you have and who is using it not only allows you to pay for what you need, but also to protect and defend effectively what you are actually running.

Compliance

Promisec can ensure compliance of your endpoints thru continuous monitoring of your environments adherence to a golden image or standards configuration. This golden image can be quickly defined by pointing to a real system or created custom by you. Promisec can leverage known standards such as NIST and CIS policy definitions and supports PCI-DSS, HIPAA, SOX, FISMA, GLBA and other regulations. Promisec can also detect and enforce all Grop Policy definitions.

About Promisec

Promisec is a pioneer in endpoint visibility and remediation, empowering organizations to avoid threats and disarm attacks that can lead to unwanted headlines and penalties. Promisec's technology assures users that their endpoints are secure, audits are clean, regulations are met and vulnerabilities are addressed proactively to ensure the integrity of enterprise IT. More than 450 globally recognized companies trust in Promisec to stay secure and operationally efficient.
